Business Fest Web Application — Proposed Database Structure

I am preparing the database in PostgreSQL using pgAdmin. For now, we will use the following proposed database structure for frontend and backend development.

1. Users Table (`users`)

- `user_id` — Primary Key
- `full_name`
- `email` — Unique
- `password_hash`
- `role` — representative / judge / admin
- `created_at`

2. Sectors Table (`sectors`)

- `sector_id` — Primary Key
- `sector_name` — Unique
- `description`

3. Registrations Table (`registrations`)

- `registration_id` — Primary Key
- `submitted_by` — Foreign Key → users.user_id
- `sector_id` — Foreign Key → sectors.sector_id
- `startup_name`
- `description`
- `team_details`
- `contact_email`
- `status` — pending / approved / rejected / correction_requested
- `reviewed_by` — Foreign Key → users.user_id
- `reviewed_at`
- `created_at`

4. Startups Table (`startups`)

- `startup_id` — Primary Key
- `registration_id` — Foreign Key → registrations.registration_id (Unique)
- `sector_id` — Foreign Key → sectors.sector_id
- `startup_name`
- `description`
- `team_details`
- `contact_email`

- `is_published` — Boolean
- `created_at`

5. Ratings Table (`ratings`)

- `rating_id` — Primary Key
- `startup_id` — Foreign Key → startups.startup_id
- `rater_id` — Foreign Key → users.user_id
- `rating_type` — judge / audience
- `score`
- `feedback`
- `created_at`

6. Audit Logs Table (`audit_logs`)

- `log_id` — Primary Key
- `user_id` — Foreign Key → users.user_id
- `action`
- `details`
- `created_at`

Important points:

1. Only approved and published startups should appear publicly.
2. Users must log in before submitting ratings where authentication is required.
3. Duplicate ratings must be prevented according to event rules.
4. The leaderboard will calculate rankings from valid ratings.
5. The final scoring criteria and score range still need to be confirmed.
